

Liam ABOUROUSSE

Software Engineer — Python, Data Products & SaaS B2B

Paris, France
+33 6 07 88 90 56

liam.abourousse@efrei.net | github.com/bardakor | linkedin.com/in/liam-abourousse

Product-oriented software engineer with hands-on experience in Python development, APIs, data pipelines, and B2B SaaS tools used by business teams. I enjoy building products that turn complex data into operational decisions: optimization, pricing, capacity management, reporting, internal UX, and automation.

Professional Experience

Software / Data Engineer — Amphitrite, Maritime DeepTech spun out of École Polytechnique (X) Nov. 2024 – Aug. 2026

Final-year work-study program — Python backend, data engineering, SaaS product, applied AI

- Developed backend services, REST APIs, and production data workflows for a B2B platform used by operational teams and enterprise clients.
- Designed pipelines for multi-source maritime data: AIS, navigation history, weather-ocean data, vessel performance. Data normalization, validation, quality control, anomaly detection, and preparation for analytical models.
- Contributed to the **Voyage Insights** product: Excel/CSV ingestion, column mapping, business enrichment, KPI computation, dashboards, analytical exports, and automated PDF report generation.
- Built internal tools and admin interfaces with **Next.js**, **Supabase**, **SQL**, **APIs**, and scheduled tasks to improve production reliability and reduce manual operations.
- Worked daily with product, data, front-end, and business teams: clarifying business requirements, prioritizing simple solutions, improving user experience, and communicating technical concepts clearly.
- Industrialized components: **Docker**, **CI/CD**, testing, logging, monitoring, technical documentation, code reviews, and ongoing reduction of technical debt.
- Contributed to GenAI / RAG workflows where relevant: semantic extraction, embeddings, data structuring, business analysis generation, and output quality control.

Technical Projects & Award

KP:AI — KPMG France IntelligenceIA Hackathon — Winning Project

- Won against more than **100 teams** and **350 engineering students**.
- Designed a decision-support digital twin for supply chain management: scenario simulation, cost / lead-time / carbon optimization, and clear reporting for business decision-makers.
- Product-oriented role: understanding overall needs, structuring the value proposition, data architecture, and final presentation to the jury.

Automated Maritime Voyage Analysis Platform

- System combining APIs, file ingestion, Python processing, weather-ocean enrichment, and generation of reports usable by non-technical users.
- Goal: turn heterogeneous data into simple indicators to track performance, early/late arrival, route consistency, and forecast quality.

Technical Skills

Backend: Python, FastAPI / Flask, REST APIs, SQL, modular architecture, testing, documentation, code quality
Data: ETL, data quality, validation, feature engineering, KPIs, dashboards, business reporting, spatiotemporal data
Databases: PostgreSQL, MySQL, Oracle SQL, Supabase, NoSQL, Elasticsearch / Redis
Frontend: TypeScript, JavaScript, Next.js, Vue.js, Angular, admin interfaces, business UX
DevOps: Docker, GitHub Actions / GitLab CI/CD, monitoring, logging, Grafana, Kubernetes
Applied AI: LLMs, RAG, embeddings, semantic extraction, prompt engineering, evaluation

Education

EFREI Paris Panthéon-Assas

Sept. 2021 – June 2026

Engineering Degree — specialization in Data Engineering, AI, Distributed Systems, and Cloud

Languages: French (native), English C1 — TOEIC 985/990
